

HOUSTONBUSINESSROUNDTABLE

BOOST ENGINEERING QUALITY

Jim Cravens
17 June 2015

Biography: Jim Cravens

Title:

- Sr. Executive Associate, Pathfinder, LLC

Degrees:

- BA, Southern Benedictine College

Years of Experience/Professional Field:

- 40 year Project Control professional with particular skill in the implementation of Cost/Schedule control systems and procedures.
- Involved in the design and implementation of processes aimed at the measurement and control of Engineering
- 7 years as Director of Engineering Project Controls with responsibility for Engineering Cost and Schedule control on more than 35 large EPC projects
- Served as Vice President of Project Controls and Estimating for a large EPC Contractor responsible for the Project Controls function on all significant projects

Contents

- Introduction
- Quality Issues
- The Way Forward
- Conclusion

The image features the word "INTRODUCTION" centered in a dark blue, sans-serif font. The text is framed by two large, light blue, wavy lines that curve around it, creating a sense of depth and movement. At the bottom of the image, there is a solid dark blue horizontal band.

INTRODUCTION

Introduction

- Last round of major project expansions has shown that engineering quality is significant issue
- Concern due to:
 - Poor project definition from Owners
 - Miscommunication between Owners and Contractors
 - “More for Less” expectations by Owners
 - Less experienced staff on Contractor side
- Engineering deliverables are handed over late & not aligned with Owner’s business needs/objectives
 - In some cases, not suitable for Bid Packages

Introduction

- Industry leaders say biggest factor affecting quality is lack of experienced technical staff
- Expansion in activity but limited increase in skilled resources
 - Senior-level engineers can't handle workload
 - Junior Level lack experience

Introduction

- Industry has partially filled gap with tools but this approach may:
 - Reduce users' knowledge of engineering fundamentals and rob early career staff of valuable experience
 - Result in lack of awareness of what “good” looks Like
 - Mislead inexperienced engineers who believe:

**“If the system spits it out,
it must be good!”**

Introduction

- Even with more electronic systems & tools, engineering hours for projects have **not** dropped
- Engineering cost management requires balance with consideration of the following:
 - Engineering is only 12-15% of Cost
 - Procurement and Construction are primary cost drivers
 - The quality of Engineering may reduce or increase cost

Introduction

- Building projects flawlessly in today's less-experienced project team environment is more critical than reducing engineering hours
- Electronic systems add benefits but gain can be offset by other factors:
 - Poor communication between Owner and Contractor
 - Limited availability of experienced resources
 - Increases in project complexity

Engineering Skill Set vs Tool Utilization Combined Efficiency

Figure 1: Electronic tools can't fully overcome the loss in efficiency from lack of experienced staff.

The image features the text "QUALITY ISSUES" centered on a white background. The text is framed by two large, overlapping, wavy blue lines that curve around the top and bottom of the text. A solid dark blue wavy shape is located at the bottom of the page.

QUALITY ISSUES

Quality Issues

- Many cases of misaligned quality expectations related to :
 - Future expansion
 - Product flexibility
 - Capacity fluctuations
 - Reliability
- To avoid problems - Owner's engineers/operations staff/business leaders should agree on project functional objectives
 - Gives contractors clear message

Quality Issues

- Owners must drive early agreement on front-end execution, contractor and contract award
 - Allow enough time and resources to complete conceptual & basic engineering efforts

Quality Issues - ECC

Primary root-cause issues identified by industry leaders at Sept. 2014 Engineering and Construction Contracting (ECC) conference:

1. Holding contractor to pre-determined deadlines and minimizing allowable time for early contract issues, scope clarification challenges, funding delays, etc., causes inefficiencies in contractor's shop

Quality Issues - ECC

2. Overlapping Front-End planning phases

- Owners & contractors build teams by recruiting staff from other industries
- Requirements at each stage gate vary across industries/ sometimes aren't clearly defined
 - Results in misaligned expectations at phase-gate decision
 - Leads to unsatisfactory understanding of quality expectations
 - Leads to poor project results
- Violates proven industry best practice of stage gates

Quality Issues - ECC

3. Owners set unrealistic project completion deadlines – less time to complete engineering efforts
 - Leads to poor decision-making
 - Projects fail to meet target dates
 - Projects don't satisfy operability goals
 - Root cause - lack of communication regarding schedule achievability
 - Management/public target date notice released without comprehensive analysis

Quality Issues - ECC

4. How do we measure engineering effectiveness?

- Current Focus is mainly on cost & timeliness of engineering deliverables
 - Less time spent on how system/facility operates after commissioning & startup
- Ensuring efficient, trouble-free operations is true measure of engineering quality
 - Project may last a few years but asset will keep going, and going

OWNER PROJECT DELIVERY PROCESS

| 1 BUSINESS PLANNING | 2 ALTERNATIVES ANALYSIS | 3 FRONT END ENGINEERING | 4 EXECUTION -EPC- | 5 OPERATE & EVALUATE |
|--|---|--|--|--|
| <p>OBJECTIVES:</p> <ul style="list-style-type: none"> • Clearly frame goal • Identify opportunities • Test for Strategic fit with business objectives • Preliminary assessment of uncertainties, potential return and associated risks • Plan for next phase | <p>OBJECTIVES:</p> <ul style="list-style-type: none"> • Generate alternatives • Reduce uncertainty and quantify associated risks • Develop expected value for selected alternatives • Identify preferred alternative(s) • Plan for next phase | <p>OBJECTIVES:</p> <ul style="list-style-type: none"> • Fully define scope • Develop detailed execution plans • Refine estimates & economic analysis to A/R level • Confirm if expected value meets business objectives | <p>OBJECTIVES:</p> <ul style="list-style-type: none"> • Implement Execution Plan • Finalize Operating Plan • Collect, analyze, and share metrics & lessons learned | <p>OBJECTIVES:</p> <ul style="list-style-type: none"> • Monitor performance • Benchmark performance against objectives and competitors • Share results and lessons learned • Continue performance assessment and identify opportunities |

FULL PROJECT SANCTION

Quality Issues - ECC

5. Timeliness of “good ideas”

- Owner’s Project Delivery Process must promote creative thinking/innovation during pre-execution Front-End Loading phases
- Once project is authorized and full funding sanctioned, changes become problematic
 - Project team executes scope defined in accordance with execution strategy & agreed to in authorization package
- When is change in scope acceptable? – blurred lines
 - Can’t meet target cost/schedule expectations if scope is constantly changing
- “Good ideas” adopted after authorization can turn into “bad ideas” = disruptive impact on project execution

Quality Issues - ECC

6. Contractors aren't free from fault – Need to **honestly** assess what they can handle & not overtax resources

- Increased project activity causes capabilities/skills of staff to be stretched beyond effective limits
- Limited supply of engineering talent entering marketplace
- Demand for engineering & construction resources has spurred aggressive recruitment tactics
 - **Some are stealing from each other!**
- Drawing talent back into industry to address this problem demands concerted action!

The image features a white background with several decorative blue wavy lines. A thick, dark blue wave runs along the bottom edge. Two lighter blue, semi-transparent waves curve across the top and bottom of the central text area, framing it. The text "THE WAY FORWARD" is centered in a dark blue, sans-serif font.

THE WAY FORWARD

The Way Forward

Take steps to address quality issues!

- Independent Project Analysis (IPA) recently announced that the Classes of Facility Quality (CFQ) Value Improving Practice (VIP) is now recommended for all projects
 - Was optional - now standard practice
 - If executed correctly, ensures alignment among Owner's:
 - Business representatives
 - Engineering group
 - Operations staff

The Way Forward

Classes of Facility Quality (CFQ) - Cont.

- When implemented, documented and authorized properly, CFQ effort will minimize/eliminate late changes in scope due to misaligned project-quality expectations
- Is structured, decision-making process used to establish/manage scope development
- Historically has demonstrated project costs savings of up to 20% within industry
- Can reduce schedules by eliminating engineering recycle

The Way Forward

Classes of Facility Quality (CFQ) - Cont.

- CFQ must be effectively communicated to Contractor
- Contractor must execute efficiently & to industry-accepted standards
- Owner should plan spot-checks to ensure contractor is meeting quality expectations
 - If Owner lacks this internal capability - should consider external Independent Project Review (IPR) effort

The Way Forward

- Owners should hold facilitated scope clarification meeting to address issue of end-of-phase-gate required engineering scope deliverables
 - More detailed than kickoff meeting
 - Done early - at contract award
 - Ensure 100% alignment of scope issues between Owner team's expectations and Contractor's understanding of Owner's stage-gate requirements
 - Project-specific deliverables/details about quality are clearly defined & communicated
 - Done during bidding process so contractors bid effort correctly

The image features the word "Conclusions" centered in a dark blue, sans-serif font. It is framed by two large, light blue, wavy lines that curve around the text, creating a sense of enclosure. At the bottom of the image, there is a solid dark blue horizontal band.

Conclusions

Conclusions

- To improve predictability of capital projects/realize better business value - boost quality of capital project delivery process
- Improvement depends on ability to define what quality means from the Owner's view
 - Communicates quality through engineering deliverables
 - Allows project team to purchase effectively/execute in field with minimal changes
 - Results in more efficient/effective use of human resources, capital and time
 - Better business value for Owner
 - More profitability for contractors

Conclusions

- Other industry best practices that can assist in improvement:
 - Effective use of Value Engineering techniques
 - Clearly defined work-breakdown structures (WBS)
 - Application of peer reviews/Independent Project Reviews
